

Data Sanitization & Forensic Verification Certificate

Report Number:	RPT-ERS-20260902-18D4
Report Classification:	ERASURE_CERTIFICATE
Generated Timestamp:	2026-09-02 13:38:10 UTC
Operation Code:	ERS-20260902-BEB65B
Target Device:	Safe Demo Storage A (NVMe Sandbox)
Storage Type:	NVME
Sanitization Method:	NIST_800_88_PURGE
Verification Verdict:	PASSED
Residual Risk Level:	LOW

Executive & Technical Findings

- Operation ID**: `ERS-20260902-BEB65B`
- Target Resource**: `Safe Demo Storage A (NVMe Sandbox)`
- Storage Architecture**: `NVME`
- Sanitization Protocol**: `NIST\_800\_88\_PURGE`
- Operator / Authorizer**: `demo\_user`
- Timestamp**: `2026-09-02 13:38:10 UTC`

A controlled data sanitization lifecycle was executed on target media **Safe Demo Storage A (NVMe Sandbox)** under standard **NIST_800_88_PURGE**. Post-sanitization independent verification was conducted to inspect for residual data blocks, filesystem metadata remnants, and recoverable object signatures.

- Verification Decision**: **PASSED**
- Residual Signatures Detected**: `0`
- Sector Shannon Entropy**: `7.9972`
- Residual Declassification Risk**: `LOW`

The Flash Translation Layer (FTL) wear-leveling characteristics of flash storage were addressed via cryptographic purge parameters.

Target device is certified sanitized and safe for hardware declassification / repurposing according to NIST SP 800-88 Rev. 1 guidelines.

Cryptographic Chain of Custody Verification:

This document was digitally compiled by the DataShield Core Verification Engine (SIH26149). Underlying sector telemetry, SHA-256 evidence hashes, and authorization audit logs are immutably registered.
